Date:

These word problems feature real classmates from our survey, matched to our official roster — more names coming as the rest of the class turns in their surveys!

Quick recap: to **divide fractions**, use **Keep–Change–Flip**: **Keep** the first fraction the same, **Change** the $\div$ to a $\times$, and **Flip** the second fraction upside down (its reciprocal). Then multiply straight across and simplify by cancelling any shared factors.

1 Worked Example

Chamille Harris has $\frac{3}{4}$ of a spool of string left over from making one of her bracelets. If each small bracelet takes $\frac{1}{8}$ of a spool of string, how many bracelets can she make?

$$\frac{3}{4} \div \frac{1}{8} \rightarrow \text{keep} \cdot \text{change} \cdot \text{flip} \rightarrow \frac{3}{4} \times \frac{8}{1} = \frac{24}{4} \rightarrow \text{cancel a shared 4} \rightarrow \boxed{6 \text{ bracelets}}$$

2 Your Turn

Aaron Hode has $\frac{5}{6}$ of a watermelon left from lunch — his favorite fruit! He wants to cut it into slices that are each $\frac{1}{12}$ of a whole watermelon, to share with classmates including **Lauryn Davis**. How many slices can he cut?

DIVISION: ____ / ____ $\div$ ____ / ____ FLIPPED TO: ____ / ____ $\times$ ____ / ____ PRODUCT: ____ / ____ SIMPLIFIED: _____

3 Your Turn

Kynndal Jackson and **Alayna McCarty** are making bracelets together using $\frac{2}{3}$ of a yard of rose-gold ribbon. If each bracelet uses $\frac{1}{9}$ of a yard, how many bracelets can they make?

DIVISION: ____ / ____ $\div$ ____ / ____ FLIPPED TO: ____ / ____ $\times$ ____ / ____ PRODUCT: ____ / ____ SIMPLIFIED: _____

4 Your Turn

Rickale Murphy's family baked $\frac{7}{8}$ of a strawberry cheesecake, her favorite dessert. **Lorne Nelson** wants to bring some to the football game. If each serving is $\frac{1}{16}$ of the whole cheesecake, how many servings can they cut?

DIVISION: ____ / ____ $\div$ ____ / ____ FLIPPED TO: ____ / ____ $\times$ ____ / ____ PRODUCT: ____ / ____ SIMPLIFIED: _____

5 Your Turn

Carter Foster is building a model house out of wood strips for his favorite invention project. He has $\frac{5}{6}$ of a strip of wood left. If each tiny wall needs $\frac{1}{18}$ of a strip, how many walls can he build?

DIVISION: ____ / ____ $\div$ ____ / ____ FLIPPED TO: ____ / ____ $\times$ ____ / ____ PRODUCT: ____ / ____ SIMPLIFIED: _____

💡 Keep, Change, Flip — then cancel it down! 💡
