Structure Grows the Same Way in Writing and in Math

In writing, a single **word** combines with other words to build a **sentence**, and sentences combine to build a whole **paragraph**. Math shapes grow the exact same way! A **line** (just length) can multiply across a second direction to grow into a flat **area**. That area can then be mirrored across a third direction — perpendicular, at a 90° angle — to grow into a solid **volume**. Each step adds one more dimension, just like each step in writing adds one more layer of structure.

STEP 1: Line**STEP 2: Area****STEP 3: Volume****Same Idea, Two Subjects**

Writing Structure	Math Structure	Dimension	Formula
Word	Line (distance)	1D	L
Sentence (words combine)	Area (line multiplied across a width)	2D	L × W
Paragraph (sentences combine)	Volume (area mirrored across a height)	3D	L × W × H

Your Turn: Grow Your Own Shape

Start with a line that is **6 units** long. Multiply it across a width of **4 units** to grow it into an area. Then mirror that area across a height of **3 units** to grow it into a volume. Draw each step yourself, then fill in the math!

draw your 6-unit line here

draw the area (line × width) here

draw the volume (area × height) here

Length = _____ units

 $L \times W = \underline{\hspace{1cm}} \times \underline{\hspace{1cm}} = \underline{\hspace{1cm}} \text{ units}^2$ $L \times W \times H = \underline{\hspace{1cm}} \text{ units}^3$
